Power supply - precautions

1. The given parameters (unless otherwise stated) were measured for a supply voltage of 230V AC, at nominal load in laboratory conditions, at an ambient temperature of 25°C.
2. The power supply is not an independently operating device, it is designed to work as a component of devices and installations.
The EMC interference level of the power supply unit may depend on the nature of the receiver connected to it, and the total interference of the entire system also includes interference generated by other elements included in its composition.
3. The purpose of the power supply for LED lighting products may vary by region and local requirements. Before purchasing, verify the possibility of using the power supply to power LED products based on the legal requirements in the country of destination.
4. In general, serial and parallel cooperation of two or more power supplies is prohibited. It is only allowed to share one pole in a system with multiple power supplies (common "+" or "-") while following basic installation rules. This also applies to multiple power supply of elongated products, which cannot be powered from multiple sources. There may be exceptions to this rule specified in the datasheets of specific power supply models, with additional guidelines.
