Note:

The given parameters (unless otherwise stated) were measured for a supply voltage of 230V AC, at nominal load in laboratory conditions, at an ambient temperature of 25°C.

The power supply is not an independently operating device, it is designed to work as a component of devices and installations. The EMC interference level of the power supply unit may depend on the nature of the receiver connected to it, and the total interference of the entire system also includes interference generated by other elements included in its composition.

The purpose of the power supply for LED lighting products may vary by region and local requirements. Before purchasing, verify the possibility of using the power supply to power LED products based on the legal requirements in the country of destination.
